                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A proteinase K resistant surface protein has been isolated from 4 strains of N. meningitidis (AAT39039 to AAT39042). The isology of the strains of n. meningitidis (AAT39039 to AAT39042). The isology of the prevention of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may also be used to detect antibodies specific to N. meningitidis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Neisseria meningitidis antigen, highly conserved between different strains – useful for prodn. of antibodies for immunisation against, or diagnosis of, N. meningitidis infection

The isolated from 4 strains of N. meningitidis (AAR39039 to AAR39042). The isolate knowledge, antigenic fragments of antibodies can be used in a vaccine for the prevention of infection by N. meningitidis or by N. gonorrhoeae in humans. The antibodies may also be used diagnostically to detect N. meningitidis infection. The antigen may, also be used to detect antibodies specific to N. meningitidis

A claimed composition includes the NspA protein, preferably in mature form. The compositions are used e.g. as immunogenic compositions, vaccines or diagnostic reagents. They are used to treat or prevent Neisserial infection, to detect the presence of Neisserial bacteria or of antibodies raised against Neisserial bacteria, and/or as reagents which can raise antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAR73911 is the Neisseria meningitidis opacity related protein POPM3. It contains the meningitis related antigenic sequences (MRHAS) claimed in AAR73889 and AAR73901, which are recognised by a monoclona antibody from the hybridoma Rubella virus (RV)-1. The claimed MRHAS peptides may be used in immunoassays to diagnose the presence of bacterial and/or viral meningitis agents in a sample, or in prophylactic and therapeutic meningitis treatments. The peptides may also be used as vaccines against meningitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the major outer membrane protein P5 of non-typeable H. influenzae. One or more surface exposed loops of this protein may be replaced with a modified peptide of the invention. Each of these peptides contain an LB1[f] peptide which is a 19 amino acid peptide derived from the sequence of MOMP P5 from strain ntHill28, representing amino acids Arg117 to G1y135. This peptide represents the third exposed loop of P5 and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP P5 may be used to induce an immune response in a mammal to prevent or treat Haemophilus influenzae infection or associated disease, e.g., ocitis media, sinusitis, conjunctivitis, or lower

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genes themselves and the discovery of novel antibiotics, the essential coc genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella coc invention is also useful for the identification of potential new targets coc invention is also useful for the identification of potential new targets coc inventify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery compositions nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an cessential prokaryotic cellular proliferation protein.

Conte: The sequence data for this pattent did not form part compounds in electronic format directly from WIPO at

                                                                                                                                                                 QΥ
                                                                                                                                                                                                                                                                                                                The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, themselves and the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used CC to identify proteins used in proliferation, to express these proteins, CC and to obtain antibodies capable of binding to the expressed proteins. CC The proteins can be used to screen compounds in rational drug discovery CC programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in CC essential prokaryotic cellular proliferation protein.

CC Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

      The sequence represents a fusion protein of a versinia centerocolitica attachment-invasion-locus (AIL) protein (AAR96207) With maltose binding protein (MBP, AAR96208). The MBP N-terminal portion of the fusion protein acts as an affinity tail, allowing chromatography. The receptor binding region of the AIL protein combinant protein purification by amylose affinity chromatography. The receptor binding region of the AIL protein involves all or some of the regions from the 4 extracellular loops. This region retains the binding affinity of the protein, and may be used alone or as part of a fusion protein for drug delivery. The transport the agent across the gastrointestinal membrane barrier by transports to increase bioavailability 5- to 100-fold. The delivery system allows improved transport across enterocytes and eyers patch M-cells. The system is not prone to degradation in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Š

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
The fimbrin proteins from 15 randomly selected type b and non-typable clinical isolates of Haemophilus influenzae share common epitopes. Thus frimbrin isolated from non-typable Haemophilus influenzae 1128 strain is a particularly suitable immunogen to protect against the different non-typable HJ. influenzae that cause otitis media. Fimbrin protein is produced by culturing a transformed microbial host , pref. E.coli, Sporodoptera frugiperda or a mucosal
                                                                                                                                        Vaccine comprising non-typable Haemophilus influenza fimbrin protein - useful in studying, preventing or reducing the severity of otitis media, also fimbrin protein and DNA.

from Pasteurellaceae. The present sequence is a protein encoded by one such virulence gene. The virulence genes of the present invention may be mutated in order to produce an inactive gene. The inactive virulence gene may in turn be used to produce a vaccine, which is useful for treating bacterial infections such as septicemias, bronchopneumonias, rhinitis and
                                                              The family Pasteurellaceae encompasses several pathogens that infect a wide variety of animals. The present invention relates to virulence genes

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 854

A, Experimental source: strain MS11, variant 4.8
A; Note: the authors did not translate the sequence for the signal peptide
A; Note: expression of opacity proteins is regulated by the number of translated repea
of repeats place the start codon in frame with the rest of the protein
